

STROBE checklist — cross-sectional studies

#	Item	Where addressed	Status
1a	Study design in the title or abstract	Title and abstract both state "descriptive survey" / "cross-sectional online survey"	✓
1b	Informative and balanced abstract summary	Abstract (unstructured, 199 of 200 words), closing with the explicit no-prevalence, no-causal statement	✓
2	Scientific background and rationale	Introduction ¶1–3: clinical/naturalistic asymmetry, Puerto Rico's legal and cultural context, absence of prior local ceremonial-practice evidence	✓
3	Specific objectives	Introduction ¶4–5 (final two paragraphs). Objectives stated as descriptive; the safety domain's contribution is framed as a measurement priority throughout Discussion §4.3, not a test result	✓
4	Study design, presented early	Methods §2.1 ¶1	✓
5	Setting, locations, and relevant dates including recruitment and data collection	Methods §2.1: KoboToolbox, fielded 24 Feb – 9 Jun 2026 (data-derived window)	✓
6a	Eligibility criteria,	Methods §2.2: inclusion criteria (age 21+, Spanish literacy, internet access, prior ceremony)	✓

#	Item	Where addressed	Status
	sources, and methods of participant selection	participation) and recruitment channels (convenience/chain referral via social media and campus bulletin boards)	
7	Clearly defined outcomes, exposures, predictors, confounders, effect modifiers	Methods §2.4 (Measurement); verbatim wording and anchors in Table 1. Referent differences between the outcome, primary exposure, and safety items are stated in §2.4 and the safety-domain referent mismatch is repeated in Discussion §4.3 and Limitations §4.4	✓
8	Data sources and measurement methods for each variable	Methods §2.4; Table 1. Three substance variables explicitly kept distinct (§2.4, last sentence); both the lifetime and most-recent-ceremony non-consensual-contact items are defined	✓
9	Efforts to address sources of bias	Methods §2.5 (structural-skip separation, duplicate screening via nickname/password, branch-specific attention checks). Methods §2.5 states the bottom-line result (one exact match, already excluded as an abandoned duplicate; no analytic row excluded) without the itemized signal breakdown. Self-selection addressed in Discussion §4.1 ¶3 with a web-survey selection-bias citation	✓
10	Study size and how it was arrived at	Methods §2.2: protocol target of 100 responses, met. No a priori power calculation exists.	⚠ No a priori power analysis exists
11	Handling of quantitative variables and	Methods §2.6 (ordinal treatment of the outcome); Results §3.2 states the most-recent-ceremony substance grouping rule in text. The outcome-	✓

#	Item	Where addressed	Status
	groupings	collapsing rule used for the (now-dropped) proportional-odds model previously lived in Suppl.	
12a	Statistical methods including confounding control	Methods §2.6	✓
12b	How missing data were addressed	Methods §2.5: structural skips reported as their own column in Table 2 (missingness decomposition) and as a labeled row in Tables 4–5; item nonresponse as the residual; per-item bases throughout; "prefer not to answer" retained as a category	✓
12c	Sampling strategy accounted for in analysis	Methods §2.1: non-probability sample, unweighted analysis, stated explicitly	✓
12d	Sensitivity analyses	Methods §2.6 and Results §3.6: tie-aware permutation robustness check on the primary comparison. The three-level sensitivity re-run and the separate duplicate-adjudication sensitivity check previously described in Suppl. Methods §2.5 states the adjudication result (zero exclusions needed) without the full comparison	✓
13a	Numbers at each stage: eligible, examined, included, analyzed	Methods §2.2 and Figure 1: 100 → 13 abandoned → 87 at the role fork → 14 screened out → N=73 → 72 participant-side / 8 facilitator-side. 67 routed to the participant section (corrected from an earlier 69: 3 dual-role respondents stopped at the continuation gate plus 2 who answered "prefer not to answer" to the facilitator-role item, both shown as separate exits in Figure 1's caption)	✓

#	Item	Where addressed	Status
13b	Reasons for non-participation	Methods §2.2: 13 abandoned before any substantive item; 14 answered "no" to both role items (16% of those reaching the role fork)	✓
13c	Participant flow diagram	Figure 1 (generated from the analysis pipeline; every count recomputes from raw data)	✓
14a	Participant characteristics and information on exposures/ confounders	Results §3.1; Table 3 (sociodemographics — renumbered from Table 1 in earlier drafts once the item-wording and missingness tables were folded in ahead of it)	✓
14b	Number of participants with missing data per variable	Table 2 (missingness decomposition, every item); Tables 4–5 carry per-item structural-skip/ nonresponse rows; Figure 3's caption decomposes its 9-person remainder into 1 "prefer not to answer," 5 structural skips, 3 nonresponses	✓
15	Report numbers of outcome events or summary measures	Results §3.2–§3.4; Tables 3–5; Figures 2–4	✓
16a	Unadjusted and confounder-adjusted estimates with precision	Results §3.6: unadjusted Mann–Whitney with rank-biserial r and common-language effect size.	✓
16b	Category boundaries	Results §3.2 (substance grouping, stated in text). The outcome-collapsing boundaries for the	✓ (for what

#	Item	Where addressed	Status
	when continuous variables were categorized	proportional-odds model are moot since that model is not in the submission	remains in-scope)
16c	Translation of relative risk into absolute risk where meaningful	Not applicable — no relative-risk estimates are reported; the single prevalence figure is reported absolutely with a Wilson CI (Results §3.4)	n/a
17	Key results with reference to study objectives	Discussion §4.1–§4.3 and §4.5 (Conclusion)	✓
18	Limitations, including sources of bias and imprecision	Discussion §4.4 (Limitations): self-selection, non-independence of facilitator/participant branches, ceremony-level unlinkage, both referent mismatches, recall distance, unvalidated instrument, both skip-logic errors described in full	✓
19	Cautious overall interpretation	Discussion throughout; every inferential result is labeled exploratory; §4.5 (Conclusion) states no prevalence or causal inference is supported	✓
20	Generalizability	Discussion §4.4 ¶1 (Limitations, first paragraph): self-selection, education/economic skew, non-Puerto Rico residents (6%), unenforced eligibility criteria	✓
21	Funding and role of funders	Funding statement (after Discussion, unnumbered): no specific grant	✓
